AARAV JIT

Linux, Systems and Infrastructure · Cybersecurity Student

Sacramento, CA | aaravjit16@gmail.com | aaravjit.github.io | github.com/AaravJit | linkedin.com/in/aarav-jit-499a93293

SUMMARY

Cybersecurity and Information Assurance student who builds the systems side of software: a Linux installer with hardware detection and automatic rollback, and cloud backends whose access rules are enforced and tested in Postgres. Two-plus years in high-volume retail fulfillment.

TECHNICAL SKILLS

Linux and OS: Arch Linux, systemd, journalctl, pacman, Bash; Windows 10/11, PowerShell (basic)

Backend and data: PostgreSQL, row-level security, Supabase (Auth, Edge Functions, Storage), PostGIS, Stripe webhooks

Languages: Bash, Python, TypeScript, SQL

Tooling: Git, GitHub Actions, Vitest, pgTAP, Vercel, AI coding agents (Claude Code, Codex)

Networking: TCP/IP, IPv4 addressing, DNS, DHCP, ICMP, switching and routing (coursework)

PROJECTS

Built with AI coding agents under my direction: I wrote the specs, set the architecture and security requirements, reviewed every change and tested it. Case studies at aaravjit.github.io.

Aarav Hyprland: portable Arch Linux desktop installer 2026

github.com/AaravJit/aarav-hyprland

- Designed an installer that detects hardware (lspci, /sys), renders a per-machine configuration, validates every Lua, JSON and TOML file in a dry run, and only then installs.
- Made installs fail closed: set -Eeuo pipefail, SHA-256 checksummed backups, and an EXIT trap that restores the prior state of files and systemd units on any failure.
- Fixed a GPU detection bug (substring “ati” matched “Corporation”) by keying on PCI vendor IDs; scoped systemd user services to Hyprland sessions with ExecCondition drop-ins.

Pull Up: native iOS app on Supabase 2026–present

github.com/AaravJit/pull-up

- Led a native Swift rebuild with privacy rules enforced in Postgres row-level security; 30 pgTAP test files, 262 of 262 checks passing on the hosted staging project.
- Drove a written security assessment with 19 fixed findings (route leakage, location metadata in uploads, keychain backup class), each Phase 3 fix covered by a regression test.

RoadPing: push-to-talk app for nearby drivers 2026–present

github.com/AaravJit/RoadPing

- Designed a location-privacy model where no client can read coordinates: nearby drivers return as one of four distance bands from grid-snapped positions, held 30 s per viewer.
- Specified a pgTAP test that replays 2,300 session restarts to prove range changes reveal nothing finer than a band; 15 Edge Functions and 13 SQL migrations.

EXPERIENCE

Walmart, Digital Personal Shopper (Online Grocery Pickup) Jun 2024 – Present

Citrus Heights, CA

- Work in Walmart’s inventory and order-management systems to pick, stage and hand off online orders accurately while priorities change through each shift.
- Resolve order issues and substitutions directly with customers, and escalate problems that need a manager.
- Follow documented procedures and coordinate across teams so handoffs stay on time.

Target, Seasonal Fulfillment Expert Nov 2023 – Jan 2024

Sacramento, CA

- Used handheld fulfillment and inventory systems to locate, verify, stage and prepare orders under seasonal deadlines.
- Kept order accuracy up while supporting the team’s workflow during peak demand.

EDUCATION

American River College, Sacramento, CA Fall 2026 – Present

Cybersecurity and Information Assurance (A.S. program, in progress)

Coursework: Introduction to Networks; Switching, Routing, and Wireless Essentials; Network Systems Administration; Network Security Fundamentals

California State University, Sacramento Prior coursework

Computer Science coursework in programming fundamentals and data structures; no degree.
