AARAV JIT

Software and Product Engineering · Cybersecurity Student

Sacramento, CA | aaravjit16@gmail.com | aaravjit.github.io | github.com/AaravJit | linkedin.com/in/aarav-jit-499a93293

SUMMARY

Builder of full applications from spec to deployment: authentication, data models with database-enforced access control, payments, background jobs and validated AI features. I work with AI coding agents and own the architecture, review and testing. Cybersecurity and Information Assurance student.

TECHNICAL SKILLS

Languages: TypeScript, SQL, Python, Bash; Swift (agent-implemented, reviewed)

Web and backend: React, Next.js, Supabase, PostgreSQL, Prisma, Stripe, OpenAI Responses API

Practices: Row-level security, server-side validation of model output, queued jobs, unit testing (Vitest), pgTAP

Tooling: Git, GitHub Actions, Vercel, Netlify, AI coding agents (Claude Code, Codex)

PROJECTS

Built with AI coding agents under my direction: I wrote the specs, set the architecture and security requirements, reviewed every change and tested it. Case studies at aaravjit.github.io.

Pathway: AI-assisted resume tailoring app 2026–present

aaravjit.github.io/projects/pathway

- Planned and shipped the product across 18 pull requests on Next.js, OpenAI, Supabase and Stripe; resume upload to PDF download works end to end.
- Validated every model response on the server (type checks, clamped score, allow-listed verdict) and enforced per-user access with Postgres row-level security on all tables.
- Replaced headless Chromium PDF rendering with pdf-lib, removing two dependencies and 175 net lines of code.

Pull Up: native iOS app on Supabase 2026–present

github.com/AaravJit/pull-up

- Led a native Swift rebuild with privacy rules enforced in Postgres row-level security; 30 pgTAP test files, 262 of 262 checks passing on the hosted staging project.
- Drove a written security assessment with 19 fixed findings (route leakage, location metadata in uploads, keychain backup class), each Phase 3 fix covered by a regression test.

RoadPing: push-to-talk app for nearby drivers 2026–present

github.com/AaravJit/RoadPing

- Designed a location-privacy model where no client can read coordinates: nearby drivers return as one of four distance bands from grid-snapped positions, held 30 s per viewer.
- Specified a pgTAP test that replays 2,300 session restarts to prove range changes reveal nothing finer than a band; 15 Edge Functions and 13 SQL migrations.

EXPERIENCE

Walmart, Digital Personal Shopper (Online Grocery Pickup) Jun 2024 – Present

Citrus Heights, CA

- Work in Walmart's inventory and order-management systems to pick, stage and hand off online orders accurately while priorities change through each shift.
- Resolve order issues and substitutions directly with customers, and escalate problems that need a manager.
- Follow documented procedures and coordinate across teams so handoffs stay on time.

Target, Seasonal Fulfillment Expert Nov 2023 – Jan 2024

Sacramento, CA

- Used handheld fulfillment and inventory systems to locate, verify, stage and prepare orders under seasonal deadlines.
- Kept order accuracy up while supporting the team's workflow during peak demand.

EDUCATION

American River College, Sacramento, CA Fall 2026 – Present

Cybersecurity and Information Assurance (A.S. program, in progress)

Coursework: Introduction to Networks; Switching, Routing, and Wireless Essentials; Network Systems Administration; Network Security Fundamentals

California State University, Sacramento Prior coursework

Computer Science coursework in programming fundamentals and data structures; no degree.
